Hi, I have 2 problems on drupal "Toyota-hawaii" project

(1) All the images are not displayed when I go to the home page:

(2) When I go to Vehicles → "pick a car for example 2015 Corolla" → Build

So, something is wrong. But the following pages I will explain what I did to setup the project:

(1) I made sure my virtual hosts were working by doing the following:

(1A) Inside file C:\Windows\System32\drivers\etc\hosts, I added

```
127.0.0.1     localhost
127.0.0.1     dummy.cheeseburger.com
127.0.0.1     dummy.hotdog.com
127.0.0.1     dummy.chicken.com
127.0.0.1     dummy.toyota.com
```

(1B) Inside file C:\wamp\bin\apache\apache2.4.9\conf\httpd.conf
This is some of the settings:

```
# DocumentRoot: The directory out of which you will serve your
# documents. By default, all requests are taken from this directory, but
# symbolic links and aliases may be used to point to other locations.
#
DocumentRoot "c:/wamp/www/"

# Listen: Allows you to bind Apache to specific IP addresses and/or
# ports, instead of the default. See also the <VirtualHost>
# directive.
#
# Change this to Listen on specific IP addresses as shown below to
# prevent Apache from glomming onto all bound IP addresses.
#
#Listen 12.34.56.78:80
Listen 0.0.0.0:8080
Listen [::0]:8080

# Virtual hosts
Include conf/extra/httpd-vhosts.conf
```

(1C) Inside file C:\wamp\bin\apache\apache2.4.9\conf\extra\httpd-vhosts.conf
This is what my file looks like:

```
<VirtualHost *:8080>
    ServerAdmin webmaster@dummy-host.example.com
    DocumentRoot "C:\wamp\www\AAAAA"
    ServerName dummy.cheeseburger.com
    ErrorLog  "logs/dummy.cheeseburger.com-error.log"
    CustomLog "logs/dummy.cheeseburger.com-access.log" common
</VirtualHost>

<VirtualHost *:8080>
```

```
    ServerAdmin webmaster@dummy-host2.example.com
    DocumentRoot "C:\wamp\www\BBBBB"
    ServerName dummy.hotdog.com
    ErrorLog  "logs/dummy.hotdog.com-error.log"
    CustomLog "logs/dummy.hotdog.com-access.log" common
</VirtualHost>

<VirtualHost *:8080>
    ServerAdmin webmaster@dummy-host3.example.com
    DocumentRoot "C:\wamp\www\CCCCC"
    ServerName dummy.chicken.com
    ErrorLog  "logs/dummy.chicken.com-error.log"
    CustomLog "logs/dummy.chicken.com-access.log" common
</VirtualHost>

<VirtualHost *:8080>
    ServerAdmin webmaster@dummy-host4.example.com
    DocumentRoot "C:\wamp\www"
    ServerName dummy.toyota.com
    ErrorLog  "logs/dummy.toyota.com-error.log"
    CustomLog "logs/dummy.toyota.com-access.log" common
</VirtualHost>
```

(1D) I made a new folder C:\wamp\www\AAAAA
And put inside it a new file called index.php which looks like this:

```
<!DOCTYPE html>
 <html>
 <body>
<?php
 echo "A";
 echo "A";
 echo "A";
 echo "A";
 echo "A";
 ?>
 </body>
 </html>
```

(1E) I made a new folder C:\wamp\www\BBBBB
And put inside it a new file called index.php which looks like this:

```
<!DOCTYPE html>
 <html>
 <body>
<?php
```

```
 echo "B";
 echo "B";
 echo "B";
 echo "B";
 echo "B";
 ?>
 </body>
 </html>
```

(1F) I made a new folder C:\wamp\www\CCCCC
And put inside it a new file called index.php which looks like this:

```
<!DOCTYPE html>
 <html>
 <body>
<?php
 echo "C";
 echo "C";
 echo "C";
 echo "C";
 echo "C";
 ?>
 </body>
 </html>
```

(1G) I cleared my internet explorer cache.
I did   ipconfig /flushdns

And then I did a "Restart All Services" on my WAMPServer
So now when I use my web-browser and go to
http://dummy.cheeseburger.com:8080
or
http://dummy.hotdog.com:8080
or
http://dummy.chicken.com:8080

I proved to myself that I successfully setup virtual hosts on my machine for Apache,
Because I get the following in internet-explorer web-browser:

Ok so in the next pages, I get the code from github.

(2) Ok, so then I went to github and got the latest code from
https://github.com/RevaComm/toyota-hawaii
and made sure all the code was inside
C:\wamp\www

(3) I went to my WAMP MySql using phpMyAdmin and created a user called
reva01sa
And granted reva01sa all Global privileges and power.

And then I created a new database called
toyota_live

And then I unzipped the email file attachment I got from Luke on May18,2015 and then
imported into database toyota_live with the script called
toyota_live.sql

And the database was successfully updated:

(4) I copied the file
C:\wamp\www\sites\default\default.settings.php
To
C:\wamp\www\sites\default\settings.php

And then inside settings.php I made the following settings:

```
$databases = array (
  'default' =>
  array (
    'default' =>
    array (
      'database' => 'toyota_live',
      'username' => 'reva01sa',
      'password' => 'abc',
      'host' => 'devtwo',
      'port' => '3306',
      'driver' => 'mysql',
      'prefix' => '',
    ),
  ),
);
```
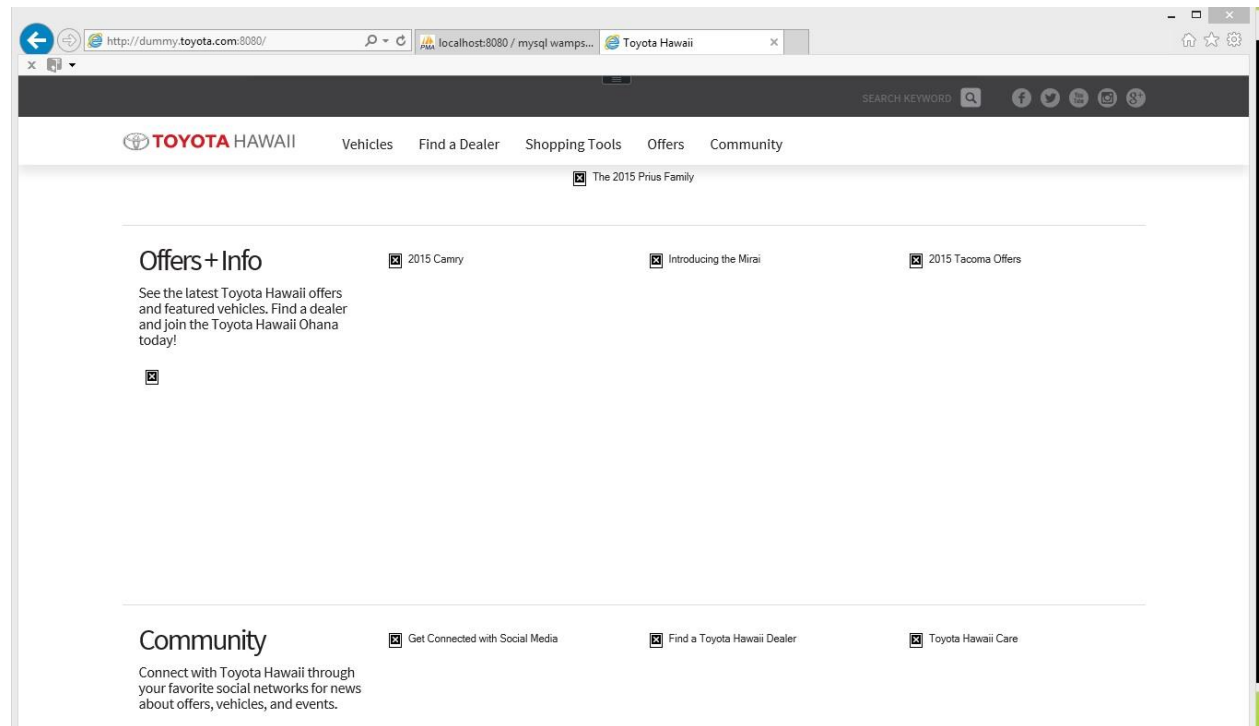

$base_url = 'http://dummy.toyota.com:8080'; // NO trailing slash!

Ok so now I did a
(1) Ipconfig /flushdns
(2) Cleared my internet explorer cache again
(3) And restarted all of my WAMP services again

Just to be on the safe side because I can get a little too paranoid

But when I go to http://dummy.toyota.com:8080 I do not get all the images:

And when I go to click on Vehicles→Camry 2015→Build I get page not found:
